INTRODUCTION

Thank you for purchasing **di-GPS®** Eco ProSumer PS10-M series GPS receiver (digital images GPS).

di-GPS® Eco ProSumer PS10-M series GPS receiver (thereafter “Eco PS10-M GPS”) is specially designed for a DSLR (Digital Single-lens Reflex) camera. It provides real time position (latitude, longitude, elevation) and the precise time (UTC time) information to your DSLR camera. It records the locations to each digital image file so that you will never forget the exact location where you took the pictures.

Eco PS10-M GPS has built with the latest third generation MTK MT3339 ultra low power consumption GPS engine. It supports up to 66 channels of satellite tracking with -165dBm sensitivity. Eco PS10-M GPS repeats the last fixed position⁽¹⁾ when no GPS signal is available or the unit is out of GPS coverage with real UTC date/time.

Eco PS10-M GPS allows you to save your present location data to your digital image file. Its State-Of-The-Art technology provides extremely fast TTFF (Time-To-First-Fix), unrivaled high sensitivity and superior performance in virtually any outdoor environment. Eco PS10-M GPS receiver can work in a place where GPS was not possible before: in the woods, under very heavy foliage, canyons, terrain obstructions, in cities with densely populated high-rise buildings and even inside a train or a car, with no external antenna required. It is designed to meet the rigorous demands of today's digital photographers.

CONNECTING ECO PS10-M GPS TO CAMERA

Direct connect Eco PS10-M GPS to the accessory terminal of the DSLR camera body.

How the strip
be attached

Remote control accessory can be connected to the 2.5mm remote terminal of Eco PS10-M GPS for remote shutter release.

NOTE

- Eco PS10-M GPS cannot be turned on when the camera is not connected.
- Please refer to user guide of your DSLR for more information on taking photographs with a GPS receiver.
- Be sure to turn off your camera before disconnecting Eco PS10-M GPS. Do not connect or disconnect Eco PS10-M GPS while the camera is on. Failure to observe this precaution could cause a malfunction of the camera.
- Do not carry the camera by Eco PS10-M GPS or subject the camera or the unit to physical shocks while the unit is connected. Failure to observe this precaution could result in physical damage of the unit or the camera's GPS terminals.
- Re-place the caps on the camera when the terminals are not in use.

CONNECTING ECO PS10-M GPS TO CAMERA

Connect the DSLR camera and Eco PS10-M GPS as described below.

1. Turn off the camera.
2. Remove the cap from the accessory terminal on the camera body.
3. Attach the Eco PS10-M GPS directly to the accessory terminal on camera. Do not use any extension cord.
4. Switch the power mode to "On" or "Auto".
5. Turn the camera on.
6. If Eco PS10-M GPS is properly connected, the camera will display a blinking icon on the top control panel / LCD monitor of DSLR camera. It means Eco PS10-M GPS is searching for a signal. The icon will stop blinking once signal has been established and Eco PS10-M GPS is ready for supplying the current position.
7. Eco PS10-M GPS will automatically detect the connection of the camera. It cannot be turned on when the camera is not connected whatever the power mode switch is set to "On" or "Auto". Both "On" and "Auto" mode only function when the camera is properly connected.

V1.02

RECORDING GPS DATA (III)

Each satellite broadcasts a digital message that contains two types of information. One type is ephemeris data, which includes the assigned serial number of the satellite, the status of the satellite (healthy or faulty), current date and time. The second type is almanac data which includes precise orbital position of every satellite in the system.

At the initial stage, ECO PS10-M GPS needs all these data for the position fixed. It usually takes a minute to few minutes to receive all data. An open sky outdoor environment will enable faster acquisition process. It will take a longer time at a weak signal environment. Once Eco PS10-M GPS locks to the satellites, it will take a few seconds for reacquisition even at weak signal environment.

The **EASY™** function is Embedded Assist System for quick positioning. Eco PS10-M GPS will calculate and predict automatically the single emperies (Max. up to 3 days) when power on, and save the predict information into the memory, Eco PS10-M GPS will use these information for positioning if no enough information from satellites, this function will be helpful for positioning weak signal environment.

Before the **EASY™** function works properly, Eco PS10-M GPS needs to collect enough information from satellites. The GPS usually needs 1-2 minutes to collect all information from satellites after the first fix. Please let the GPS turn on for 1-2 minutes after the first fix for the first time of use.

Eco PS10-M GPS has a memory backup capacitor inside. The capacitor can provide about two minutes power to the internal memory after disconnect from the camera of changing battery. To avoid the lost of ephemeris data in the internal memory, Eco PS10-M GPS should be connected to the camera all the time. The internal memory only consumes a very small amount of energy, it will not affect the battery life of the camera. As the ephemeris data only be good for 3 days maximum, Eco PS10-M GPS should be disconnected from the camera if the camera will not be used for a long period of time.

LAST POSITION RETENTION (“LPM”)

Eco PS10-M GPS is able to provide the **last known GPS position with current UTC date / time** ⁽¹⁾ to the DSLR camera even if there is the GPS signal is lost or the unit is out of the GPS coverage.

- **No fix** will be reported when no GPS position. The camera’s GPS icon will flash and no GPS data will be recorded.
- **A first fix** is needed during initialization before the LPR works properly.
- Current GPS position will immediately be reported to the camera once the new fix available.
- Last known GPS position with current UTC date / time will be continuously reported when the GPS signal is lost, the unit is out of GPS coverage, until there is a good position fix.
- The last known position will be saved to internal memory every 5 seconds. The GPS unit has a built-in power backup capacitor. The capacitor provides about two minutes power to the internal memory / internal clock running after disconnecting from the camera. When the power of internal capacitor exhausted, the GPS unit will report no GPS position. The camera’s GPS icon will flash and no GPS data will be recorded.
